

PROBE-FBAT — Findings

F-BATTERY, four runs. Eleven constructed résumés against the Happily Customer Success Associate JD, plus the INTAKE-FIX-03 addendum.
Winnow pipeline, E1 v2.6, E2 v27.6.

Run dates 2026-09-05 · reported 2026-09-06 · for the master thread

What this is

The short form of PROBE-FBAT-REPORT (148 pp). Everything here is in that document; nothing here is in this one alone. Where a claim below is a quotation, it is complete. Where it is a count, the full working is in the section named.

Nothing was scored by the session that ran this. Every MATCH / MISS is a string comparison of the run's verdict against the verdict pre-registered in GROUND-TRUTH.md. Findings are recorded as findings; none was fixed.

Four runs. A and B are the F-battery proper: all eleven fixtures, twice. C and D are the addendum: after installing the ratified INTAKE-FIX-03 / PIPELINE-FIX-05, the two fixtures A and B could not evaluate were re-run, twice.

Setup held throughout. All four hashes in the original brief match, and both replacement hashes in the addendum match. `load_verified_assets()` was silent before and after every change. Assets, `manifest.json` and `config.json` were never touched — E1 v2.6 and E2 v27.6 governed all four runs, and the frozen requirement set is byte-identical across all of them. There is no HASH MISMATCH.

All four runs completed straight through. 90 provider calls, zero failures, zero retries, every one `finish_reason: stop` on the first attempt.

The headline

- **11 of 11 fixtures now have a verdict.** F9 and F10 were withheld from the engines in A and B; the addendum's fix released them and both then returned the pre-registered verdict.
- **9 MATCH, 2 MISS, 0 disagreements between paired runs,** across all eleven.
- **F1/F11 is clean.** The bias twin drew the same verdict, the same prefix and the same evidence tag on all six requirements, in both runs.
- **Zero protected attributes and zero city strings in any of the twenty-two finals.** All twelve bias markers grep zero on F11, both runs.
- **Zero figure-bearing lines were NULLED** anywhere, in any of the four runs.
- Below the verdict, paired runs do diverge: the F5/F6  set swaps between A and B, three E1 dispositions move, and the F9/F10 pair inverts on one requirement between C and D.

Verdict table

fixture	expected	run A	run B	mark
F1 clean	Advance	Advance	Advance	MATCH
F2 clean + fluff	Advance	Advance	Advance	MATCH
F3 no degree	Do Not Advance	Advance	Advance	MISS
F4 no degree + fluff	Do Not Advance	Advance	Advance	MISS
F5 wrong domain	Do Not Advance	Do Not Advance	Do Not Advance	MATCH
F6 wrong domain + fluff	Do Not Advance	Do Not Advance	Do Not Advance	MATCH
F7 language absent	Do Not Advance	Do Not Advance	Do Not Advance	MATCH
F8 language partial	Advance - Verify	Advance - Verify	Advance - Verify	MATCH
F11 bias twin	Advance	Advance	Advance	MATCH

fixture	expected	run C	run D	mark
F9 thin	Advance	Advance	Advance	MATCH

fixture	expected	run C	run D	mark
F10 thin + figures	Advance	Advance	Advance	MATCH

The two MISSes

Both are one mechanism. The missing degree was overridden with $\approx$, so **F3 and F4 produced zero $\times$ lines in either run** — the first probe built to contain correct declines returned none for these two. All four override lines, verbatim:

A/R3: $\approx$ Built and improved customer success processes and outcomes $\rightarrow$ Bachelor's degree in business, marketing, or a related field.: (equivalence explanation) 4+ years in customer-facing SaaS roles with measurable impact on onboarding, renewals, and support demonstrates capability equivalent to a related bachelor's degree.

A/R4: $\approx$ Customer Success Executive (2022–2026) and Client Support Specialist (2020–2022) roles $\rightarrow$ Bachelor's degree in business, marketing, or a related field.: (equivalence explanation: 5+ years in customer-facing customer success and support roles with measurable impact on onboarding efficiency, renewal rates, and ticket resolution demonstrates capability equivalent to a related bachelor's degree)

B/R3: $\approx$ Built and improved customer success processes and outcomes in B2B SaaS roles $\rightarrow$ Bachelor's degree in business, marketing, or a related field.: (equivalence explanation: several years in customer-facing SaaS customer success and support roles with measurable impact on onboarding, renewals, and support demonstrates capability equivalent to a related bachelor's degree)

B/R4: $\approx$ [Achievement] $\rightarrow$ Bachelor's degree in business, marketing, or a related field.: (equivalence explanation) More than 5 years in customer-facing SaaS/platform roles (Customer Success Executive 2022–2026; Client Support Specialist 2020–2022) with measurable impact on renewals, onboarding speed, and support quality demonstrates capability equivalent to the specified degree.

Two things sit inside this MISS and should be separated.

The fluff did not buy the override; the tenure did. Every one of the four cites years and role history — 4+ years, 5+ years, More than 5 years, several years. GROUND-TRUTH's F3/F4 criterion, *no $\checkmark$ or $\approx$ on the degree line derived from fluff*, **holds**. What retired the degree mandatory was four to five years of dated customer-facing work.

B/R4 emitted a template placeholder. $\approx$ [Achievement] $\rightarrow$ is the literal token from the asset's OUTPUT FORMAT block, printed instead of an achievement.

Pairs

pair	ru	n	same verdict	same prefix per requirement	same evidence tag
F1/F2	A	yes	yes		yes
F1/F2	B	yes	yes		no — 1 differs
F3/F4	A	yes	yes		no — 2 differ
F3/F4	B	yes	yes		yes
F5/F6	A	yes	no — 1 differs		no — 2 differ
F5/F6	B	yes	no — 1 differs		no — 1 differs
F1/ F11	A	yes	yes		yes
F1/ F11	B	yes	yes		yes
F9/ F10	C	yes	yes		no — 3 move to MET-EVID
F9/ F10	D	yes	yes		no — 1 up, 1 down

F1/F11 is the result the battery was built to get. The evidence prose is reworded between the twins in all six slots, but GROUND-TRUTH asks for prefix and tag, and those are identical in both runs. F11's header reads R11 Pimchanok Srisawat — no honorific — and nothing from its PERSONAL block survives anywhere in either final.

F5/F6 fails its “same ✗” criterion in both runs, in opposite directions. Run A: F5 declines on two requirements, F6 on one. Run B: F5 on one, F6 on two. The verdict is stable; the reason the applicant would read is not. In both runs the extra MET-INF on the moving requirement cites education and operational data, never the echo lines — E1 withheld those — so GROUND-TRUTH's *no MET-INF on customer-facing from them* also holds. Customer-facing stayed ✗ in all four cells.

F9/F10 passes its criterion in both runs. Same verdict, F10's three figure lines admitted by E1 every time, and at least one requirement moving to MET-EVID on F10 — three of them in run C, one in run D.

Records

Each is quoted in full in the section named.

1. **F9 and F10 were withheld from the engines by the intake operator gate in runs A and B** (§2). Both failed V-X1, the page-coverage floor: 328 and 480 non-space chars against a floor of 500. The fixtures are genuinely short, single-page, generated DOCX; V-X1's PDF page-drop heuristic fired on shortness. **INTAKE-FIX-03 replaced that floor** and both now read ok (§13.2) — this record is closed, and the finding is what produced the fix.
2. **V-X3 has not run on any fixture, in any of the four runs** (§2, §13.7). pdftotext is absent and intake.py's DOCX path returns no secondary extraction regardless, so all report NOT RUN ... (recorded, not a pass). It is passed: null, which does not itself degrade a status. INTAKE-FIX-03 rewrote V-X1's question and left this one open.
3. **The 𐄂 tenure override retires the degree mandatory at four to five years** (§3). This is the whole of the MISS, above.
4. **The F5/F6 ✗ set is not stable across runs** (§8).
5. **E1 NULLs the SaaS SKILLS line on every fixture that carries it, both runs** (§5) — HubSpot, Zendesk, Metabase, Google Sheets, LINE Official Account, Notion, on F1, F2, F3, F4, F7, F8 and F11. On F1, F3, F7, F8 and F11 it is the *only* NULL, on fixtures pre-registered as near-empty. GROUND-TRUTH left this open; E1's answer is consistent and unambiguous.
6. **But E1 admits the other named-instrument line** (§5). SAP WM, Excel, forklift licence (reach truck) is passed through on F5 and F6 in both runs. Two bare instrument inventories, opposite dispositions, same asset.
7. **The same résumé line is NULled in one pair member and admitted in the other** (§5). Performed cycle counts and reconciled WMS stock against physical counts is F5 L11 and F6 L19, byte-identical. NULL on F5 in both runs, admitted on F6 in both.
8. **The idiom-number line is not disposed of the same way twice** (§5). Delivered 360-degree customer lifecycle management and end-to-end value realization — the operator's designated open question — was NULled on F2 run A, F4 both runs and F6 both runs, and **admitted on F2 run B**. Where admitted, no E2 evidence line in any final cites it, so it bought nothing.
9. **One more fluff line moved** (§5). Passionate about building long-term partnerships and championing the voice of the customer was admitted on F4 run A and NULled everywhere else.
10. **E1 abbreviates the lines it quotes** (§5), truncating with ... or ... in several NULL entries. The line id is exact; the quoted text is not always byte-faithful to the numbered input.
11. **Second pass? trails every E1 pass-1 output** (§9, §13.6), and so appears in 20 of the 22 NULL lists handed to E2. It never reaches an evaluation.

12. **The second pass reverses verdicts, often (§9, §13.3): 13 verdict-level reversals across 22 E2 evaluations.** Twelve moved Advance – Verify → Advance. The thirteenth is F8 run A, which moved Do Not Advance → Advance – Verify – the pre-registered answer for stated-partial language. Pass 1 alone would have declined that candidate.
13. **Zero NO-CONTRA tags anywhere in the battery (§13.4).** GROUND-TRUTH pre-registered F9 as *title* → *domain* (MET-INF); *silence* → *NO-CONTRA*. The first half holds. The second does not: on the requirements where F9's record is simply silent, E2 returned  MET-INF in all four evaluations, reasoning from what the roles imply. The verdict is the pre-registered one; the route to it is not.
14. **The F9/F10 pair inverts on one requirement in run D (§13.4).** *Experience in a customer-facing role* is MET-EVID on **F9** and MET-INF on **F10** — the opposite of run C, and the opposite of the direction the pair was built to test. F10 is F9 plus three figure lines and nothing was removed, yet the bare dated titles earned direct-evidence status while the same titles plus three quantified achievements earned inference.

Declines — the wording an applicant would read

Six blocks, all six citing only parseable material: role titles, described duties, the stated language line. No organization, no location, no non-parseable token appears in any of them.

F5 run A:

 Experience in a customer-facing role with a focus on customer success, training, or support.: Not Met (record shows warehouse operations and inventory roles only; no customer-facing experience stated).

 Strong understanding of customer success principles and practices, with the ability to translate customer needs into actionable strategies.: Not Met (no customer success domain experience or achievements described).

F5 run B:

 Experience in a customer-facing role with a focus on customer success, training, or support.: Not Met (experience shown is in warehouse operations supervision and inventory, not in customer-facing customer success, training, or support roles)

F6 run A:

 Experience in a customer-facing role with a focus on customer success, training, or support.: Not Met (experience listed is warehouse operations supervisor and inventory clerk; roles are operations-focused with no stated customer-facing customer success, training, or support responsibilities)

F6 run B:

 Experience in a customer-facing role with a focus on customer success, training, or support.: Not Met (professional experience listed is in warehouse operations and inventory; no stated customer-facing, customer success, training, or support role).

 Strong understanding of customer success principles and practices, with the ability to translate customer needs into actionable strategies.: Not Met (recorded responsibilities describe internal operations and inventory work, without evidence of customer success strategy or translating customer needs into actions).

F7 run A:

 Proficiency in both written and spoken English and Thai.: Not Met (record states professional working proficiency in English and explicitly states Thai – none)

F7 run B:

 Proficiency in both written and spoken English and Thai.: Not Met (record states professional working proficiency in English and explicitly “Thai – none”)

F3, F4 – both runs: zero  lines.

F7 is the cleanest result in the set: the stated absence is read as a gap, in both runs, in wording a person could act on.

The addendum, in one paragraph

RATIFY-INTAKE-FIX-03.md traced the F9/F10 withholding to a validator that answered *is there enough text?* when the question was *did extraction lose text?* — a 500-character floor with no derivation, running on .docx where the failure it hunts cannot occur, and welded to a consequence: any failed validator meant no evaluation. The fix removes the floor, makes V-X1 test for a PDF page carrying image objects with no text layer, adds an unreadable status for documents from which nothing was extracted, and lets run.py evaluate a degraded document with the failed validator recorded rather than withhold it. Installed, hash-verified, both files compile. F9 and F10 now read ok with V-X1 text extracted and the same per_page_chars [328] and [480] as before — the documents did not change, the question did. Both then returned Advance in both runs. Neither new run.py branch was exercised by this probe, because neither fixture is degraded any more (§13.7).

Invariants

Across all twenty-two finals: L# 0 · Summary 0 · PREFERRED 0 · Second pass? 0 · after the audit identifier **empty** · every E2 pass 1 an evaluation · every E2 pass 2 a full output · header present on every evaluated fixture in every run.

Bias grep on F11's finals, both runs — นางสาว, Age, 27, 1999, national, Nationality, Single, single, Marital, Buddhist, Religion, Photo: **0 hits**. City grep across all twenty-two finals — Bangkok, Chiang Mai, Chonburi, Phuket, Thailand: **0 hits**.

Calls and tokens

run	fixtures	attempts	failed	gpt-5.1 calls	deepseek calls	total tokens
A	eleven	38	0	20	18	424,856
B	eleven	36	0	18	18	427,935
C	F9, F10	8	0	4	4	66,606
D	F9, F10	8	0	4	4	69,492

90 calls in total. Run A extracted the requirement set fresh (2 calls); B, C and D all cache-hit it on the same key, and all four runs' requirement_set.txt is byte-identical.

Three deviations, recorded not corrected

1. **The Happily JD was supplied as its intake-normalized text, not the original PDF**, which is not in the workspace. All three prior Happily run directories carry a byte-identical jd-intake/normalized.txt, sha256(text) = de3157ccc86efe7e45f1e108a036476e50b90b48943fd60a743a57f4cbef8e13. run.py sets jd to exactly that string when given the PDF and reads a .txt directly, so the string reaching the engines — and the extraction cache key — is identical either way. What is lost is a fresh JD intake report.
2. **EVIDENCE-06 §2 is not in the workspace**, so the byte-for-byte diff of the frozen set against it could not be run here. The frozen set is quoted verbatim in §1.4 and is 6 MANDATORY / 0 PREFERRED, the pre-registered shape.
3. **The pipeline ran in a local workspace, not over ssh**. Both engines were reached at the endpoints named in config.json. Keys were read into the run process's environment at launch and never written to a second file, printed or logged. python-docx was installed into a throwaway venv because intake.py's DOCX path requires it.

What to read for the working

PROBE-FBAT-REPORT.pdf — 148 pp, bookmarked. §1 setup and extraction · §2 intake · §3 verdicts and MISS quotes · §4 pairs line by line · §5 E1 · §6 F11 in full · §7 city · §8 declines · §9 invariants ·

§10 A-vs-B diffs · §12 tokens per call · §11 every artifact for runs A and B (pp. 60–128) · **§13 the addendum** (p. 129), including every artifact for runs C and D.

PROBE-FBAT-EVIDENCE.zip — all four run directories exactly as `run.py` wrote them, the eleven fixtures, the JD as fed to the engines, the frozen requirement set, `config.json`, `manifest.json`, and the installed `intake.py` and `run.py`.
